Document	Information architecture, screens, interaction rules, visual system and accessibility
Version	1.0
Date	2026-11-10

1. Design principles

1. **Premium and alive, not flat.** A rich look with purposeful motion. Motion never blocks work and respects reduced-motion settings.
2. **Show the truth about data.** Every email carries a status, a reason and a checked-at date; every fact can show its source. Never present a guess as a fact.
3. **No surprise cost.** Estimate before spend, show credits and quota where decisions are made.
4. **Failure is a state, not a blank.** Running, empty, failed and partial states are designed for every list.
5. **Guided, not technical.** A wizard that explains itself, for people who are not growth engineers.
6. **Accessible by default.** Keyboard reachable, labelled, with status conveyed by text and symbol as well as colour.

2. Information architecture

Navigation map

Area	Route	Purpose
Lead requests	`/lead-requests`	Home: all runs, status, shared-with-me section
Dashboard	`/dashboard`	Totals, usage and recent activity
New request	`/new-request`, `/request/:id/intake`, `/request/:id/companies`	Wizard: product, ICP, estimate, launch; direct company upload
Request details	`/request/:id`	Leads, decision makers, competitors, drawer with signals and provenance, exports
Lead lists	`/lead-lists`	Named lists, export, shared-with-team section
Outreach	`/outreach`	Mailboxes, sequences, stats, enrollments
Watch	`/watch`	Saved searches, signal feed, alerts
Integrations	`/integrations`, `/integrations/crm`	API keys, webhooks, HubSpot
Team	`/team`	Members, roles, invites
Billing	`/billing`	Plan, balances, top-ups, invoices
Compliance	`/compliance`	Suppressions, erasure, audit log, retention
Profile	`/profile`	Account, Serper key, verifier settings

The sidebar is resizable and collapsible, hides its scrollbar while staying scrollable, and includes the workspace switcher. A help drawer gives in-context guidance.

3. Key screens

3.1 New request wizard

- Steps: describe the product (or paste text, URLs, files) then review the generated ICP, then choose the number of leads, then see the **estimate** (calls, cost, time) and optionally run a **sample**, then launch.
- Blank fields are never silently filled with hidden defaults; the wizard asks.
- The Serper key requirement is surfaced early rather than at the last step.

3.2 Request details (results)

- A table with match score, intent band, tech stack, region flag and email status chip (Verified, Likely, Risky, Invalid) with reason and checked-at on hover or in the drawer.
- States: running (live progress), empty, failed (with reason), and **partial** (a run that fails midway keeps and labels the leads found so far).
- Row actions: star, exclude, reject, add to list, verify email, retry enrichment, run waterfall, enroll in sequence.
- Exports in CSV, XLSX and PDF with the source-notice line.

3.3 Outreach

- Connect mailbox dialog with **Test connection** (SMTP and IMAP results shown inline) and a sticky footer so Cancel, Test connection and Connect stay visible on short screens.
- Sequence builder with up to 8 steps, variable chips, and a preview against a real contact.
- Stats lead with reply rate; opens are secondary because of mail-client privacy features.
- A paused mailbox shows its reason and a Resume action.

3.4 Compliance

Suppression list management, erasure, audit log and retention, written in plain language, with the public privacy and opt-out pages linked.

4. Visual system

Element	Specification
Palettes	Seven: Quarry, Midnight, Amethyst, Emerald, Sunset, Rosewood, Graphite. Chosen from the header, saved in the browser. Defined in `src/config/palettes.js` as CSS variables, so Tailwind classes such as `bg-surface/60` keep alpha support
Theme	Light and dark, toggle in the header
Surfaces	Translucent cards with blur, soft shadow and rounded corners (`card` utility)
Typography	System sans stack; bold tracked headings; tabular numerals for scores and counts
Layout	App shell with sidebar and header; content max-width per page; 16px minimum side gutter on phones
Components	`components/kit` (Button, Field, EmptyState, PageHeader, toast), `components/ui` (animated modal, effects), `components/motion` (Reveal), page-level `p3/ui` (Dialog, Tabs, Section, Pill, Loadable)
Icons	lucide-react and Tabler icons, decorative icons hidden from assistive tech
Dialogs	Portal to `body`, focus moved in on open and restored on close, focus trapped, Escape closes, backdrop click closes, body height capped at 90vh with the action footer sticky
Toasts	Shown at the top so they never cover form actions
Motion	GSAP and `motion` for staggered reveals, hover and scroll effects; disabled under `prefers-reduced-motion`

A component showcase (`/ui-lab`) is available in development only.

5. State design

Every data view defines these states:

State	Treatment
Loading	Skeleton or spinner with an accessible label (`Loadable`)
Empty	Icon, one-line explanation and a primary action (`EmptyState`)
Error	Plain-language reason and a retry or next step
Partial	Data kept, a banner states what is missing and why
Success	Toast at the top, state reflected in the UI
Disabled	Control disabled with a visible reason

6. Content and tone

- Plain, specific, short. Name the thing and the next step (“Add your Serper API key in Profile to run a sample”).
- No claim the product cannot back: the earlier “automated sequencing” copy was removed until sequences were real.
- Compliance language is factual and links to the privacy page; it is not legal advice.

7. Accessibility

Requirement	Status
Keyboard operability of all controls, visible focus	Built
Dialog focus trap, focus restore, Escape	Built
Labels and roles (tabs with `role="tablist"`, `aria-selected`, `aria-controls`)	Built
Status never by colour alone (text plus symbol)	Built
Reduced-motion respected	Built
Colour contrast across seven palettes and both themes	**Pending audit**; accent and status-chip contrast is unchecked
Screen-reader pass	Pending

8. Responsive behavior

- Layouts collapse to a single column on narrow widths; tables become stacked lists where needed.
- No horizontal page scroll; dialogs cap at 90% of viewport height and scroll internally.
- Verify at 1440, 1280x720 and phone widths before release.

9. Open design items

Item	Priority
Contrast audit of accents and status chips for all palettes	P2
Formal screen-reader review of results table and drawer	P2
Re-check “Shared with” sections with two real members	P3
Decide whether a calmer data-dense “sheet” mode is wanted for power users	P3
